Abstract Data Types, Recursivity

Objectives

Using Python to solve complex problems

- Implement simple programs using Python
- Implement functions and use object-oriented programming
- Treat exceptions
- Implement recursive algorithms

Requirements

1. Extend the application from the previous seminar by adding validators and exceptions as ADTs.

2. Implement algorithms for the following problems:
   a. A recursive version of the function f(n) = 3 * n (determine the multiples of 3).
   b. A recursive function that returns the sum of the first n integers.
   c. A function which implements the Pascal's triangle:

```
          1
        1   1
      1   2   1
    1   3   3   1
  1   4   6   4   1
1   5   10  10  5   1
```

   d. Write a function that returns the min /max of a list.
   e. Write a function, `recursive_min`, that returns the smallest value in a nested number list.

```
recursive_min [2, 9, [1, 13], 8, 6] == 1
recursive_min [2, [[13, -7], 90], [1, 100], 8, 6] == -7
```

   f. Write a function `count` that returns the number of occurrences of `target` in a nested list:

```
count(2, []) == 0
count(2, [2, 9, [2, 1, 13, 2], 8, [2, 6]]) == 4
count(7, [[9, [7, 1, 13, 2], 8], [7, 6]]) == 2
```
